

Consenting language

Thank you for participating in this study – we are truly grateful.

This project involves using “artificial intelligence” to see whether we can help build useful tools that may be relevant for different genetic conditions. We will first ask a few general questions including whether you are willing to participate, your background, and your opinion about AI tools and facial diagnostics. We will show output of a facial phenotyping tool on a series of images and ask you to “classify” or diagnose a facial image of a patient as having one of five genetic conditions or unaffected. We will show you examples in which the artificial intelligence tool correctly identified and incorrectly identified the images.

We anticipate that participation will take most people less than 20 minutes.

You may take this survey on your smart device or your desktop/laptop computer.

Please do not use the internet or textbooks. We are interested in your instinctive response to each question. Once you answer a question, you will not be able to go back.

No identifiers will be collected as part of the survey. All individual results will be maintained in an anonymous format. You will not receive your individual results. We plan to describe/publish only deidentified results. Your participation is voluntary and will not be compensated. We have been granted exemption from IRB review by the National Institutes of Health (NIH). By continuing with the survey, you agree to take part. If you have questions, encounter any difficulties or change your mind about participation, please contact Rebekah Waikel at rebekah.waikel@nih.gov.

I agree to participate

- Yes
- No

Demographic Questions from AI attitudes

I am

- a board certified or board eligible medical professional (MD, DO, GC, NP, or PA)
- a genetics trainee (resident or fellow)
- medical student
- other

Please indicate your profession

Please select your medical profession (most specialized certification).

- Medical Geneticist
- Physician
- Genetic Counselor
- Physician Assistant
- Nurse Practitioner
- Other

Please write in your medical specialty (e.g., pediatrician, endocrinologist, psychiatrist).

Please write in your medical profession.

For how long (since you became board eligible) have you been practicing?

- < 1 year
- 1 to 5 years
- 5 to 10 years
- > 10 years

How would you describe your institution?

- Community based hospital
- Academic medical or research center

- Molecular diagnostic company
- Telehealth company
- Other

Please describe your institution.

What year are you in your genetics training program?

- Year 1
- Year 2
- Year 3
- Year 4 or more

What year are you in your medical school program?

- Year 1
- Year 2
- Year 3
- Year 4

How often do you use AI tools (e.g., Face2Gene) in the diagnosis of patients?

- Routinely
- Sometimes
- Have tried once or twice
- Never
- Unsure

In your opinion, how accurate are AI tools in the diagnosis of patients with genetic conditions?

- Highly accurate
- Mostly accurate
- Inaccurate

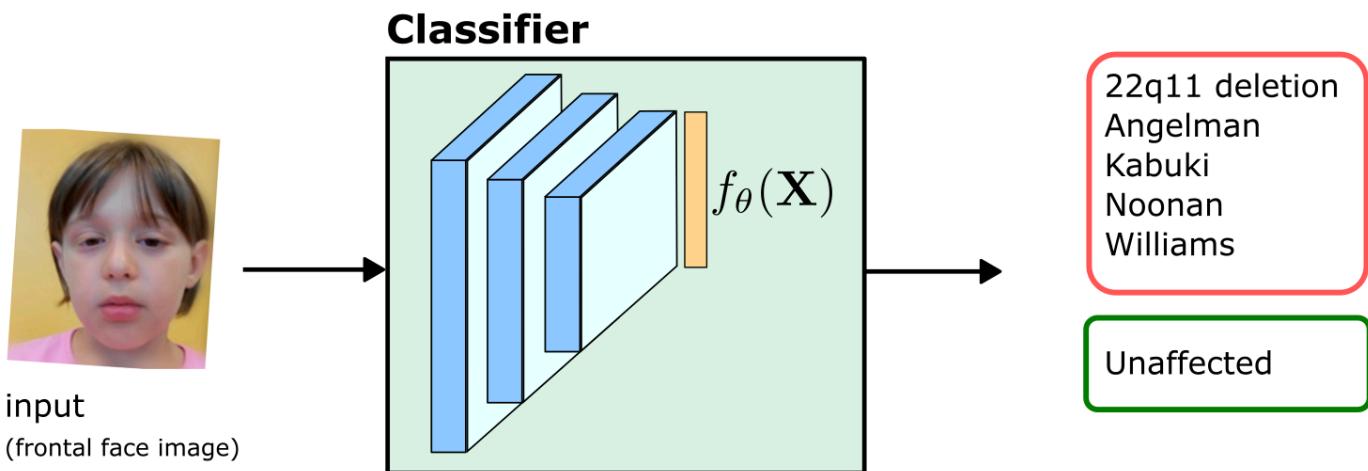

Unsure

How much weight do you place upon facial features in the diagnosis of a genetic condition?

- Major factor in diagnosis
- Intermediate factor in diagnosis
- Minor factor in diagnosis
- Not used in diagnosis

Introduction to Study

We developed an AI-based tool that can analyze an image of a person and help determine whether that patient may have a genetic condition. For this study, our tool is examining five different genetic syndromes.

During this study, you will see 18 images of individuals who are either unaffected or who have one of the following genetic conditions:

- 22q11.2 deletion syndrome
- Angelman syndrome
- Kabuki syndrome
- Noonan syndrome
- Williams syndrome

After you see each individual facial image, you will see a bar graph of the prediction probability of each syndrome or unaffected is also shown.

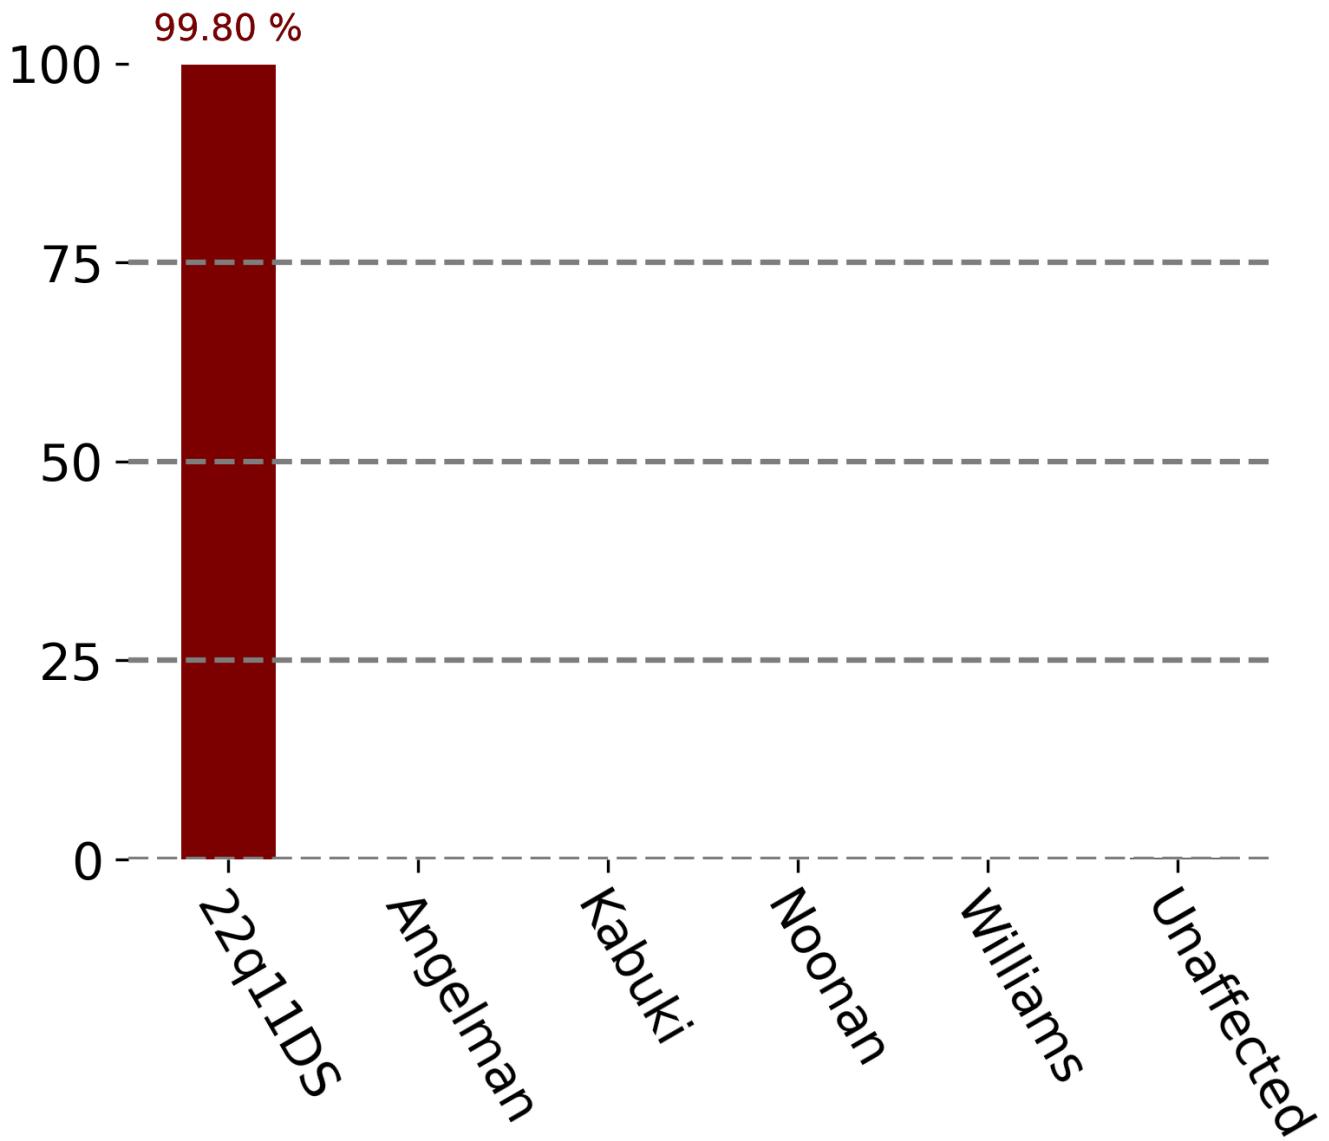

Now let's have a look at the AI tool output that you will see for each image.

- Probability Output. Bar graph showing the prediction probability of each of the 5 genetic conditions or unaffected.

image

classifier probabilities

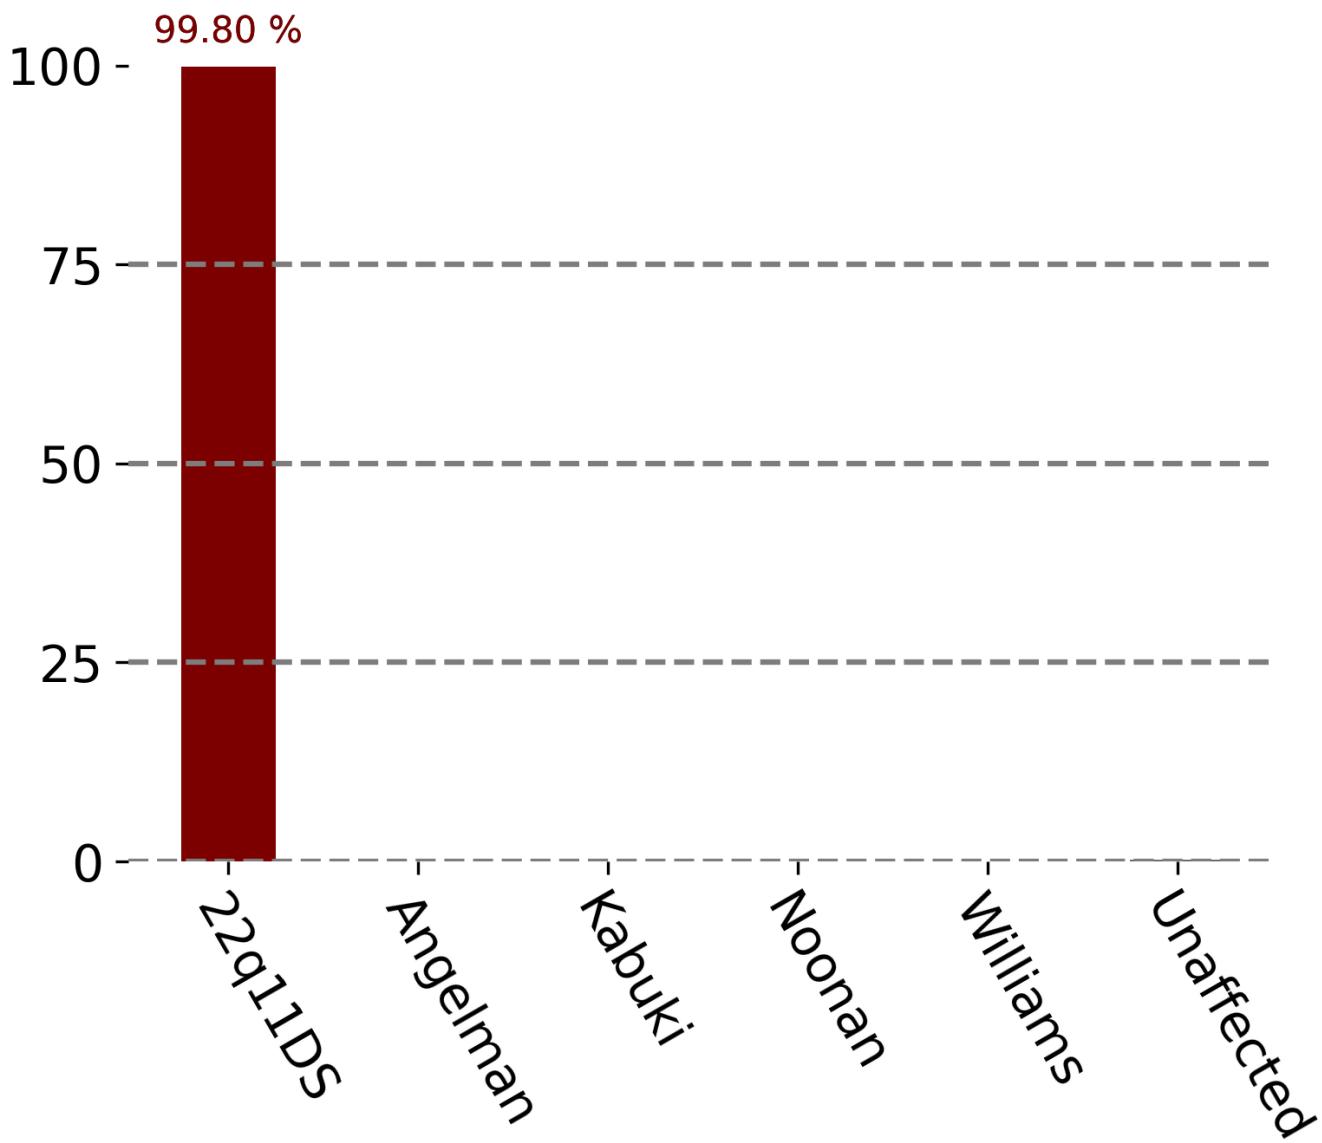

Your task is to determine if the image represents a person with a genetic condition and select condition or unaffected followed by rate your confidence in your answer (example below). First you will answer these questions based on the image alone and then you will do this again with both the prediction probability output. You will also be asked to rate the helpfulness of the output.

image

classifier probabilities

Select the name of the genetic condition.

22q11.2 deletion syndrome

Rate your confidence in the answer above.

-2 -1 0 +1 +2

Genetic Conditions

During this survey you will see images of unaffected individuals and individuals with 1 of 5 different genetic conditions.

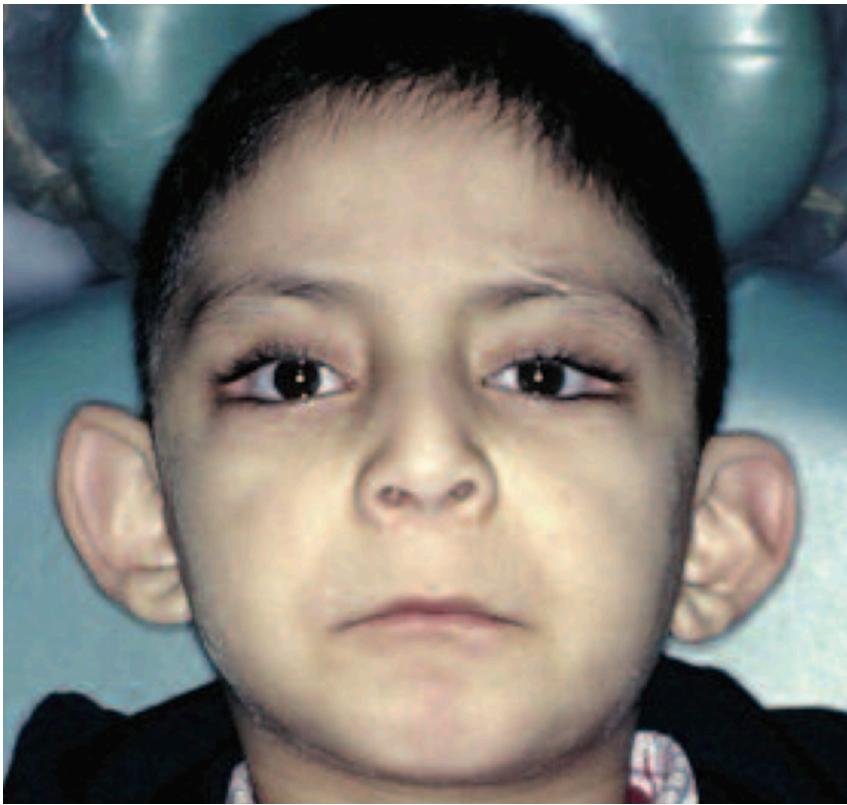

22q11.2 deletion syndrome

Facial characteristics of 22q11.2 deletion syndrome can include: malar flattening, hooded eyelids (dermatochalasis), broad nasal bridge, ear anomalies including overfolded or squared helices, as well as other findings.

Angelman syndrome

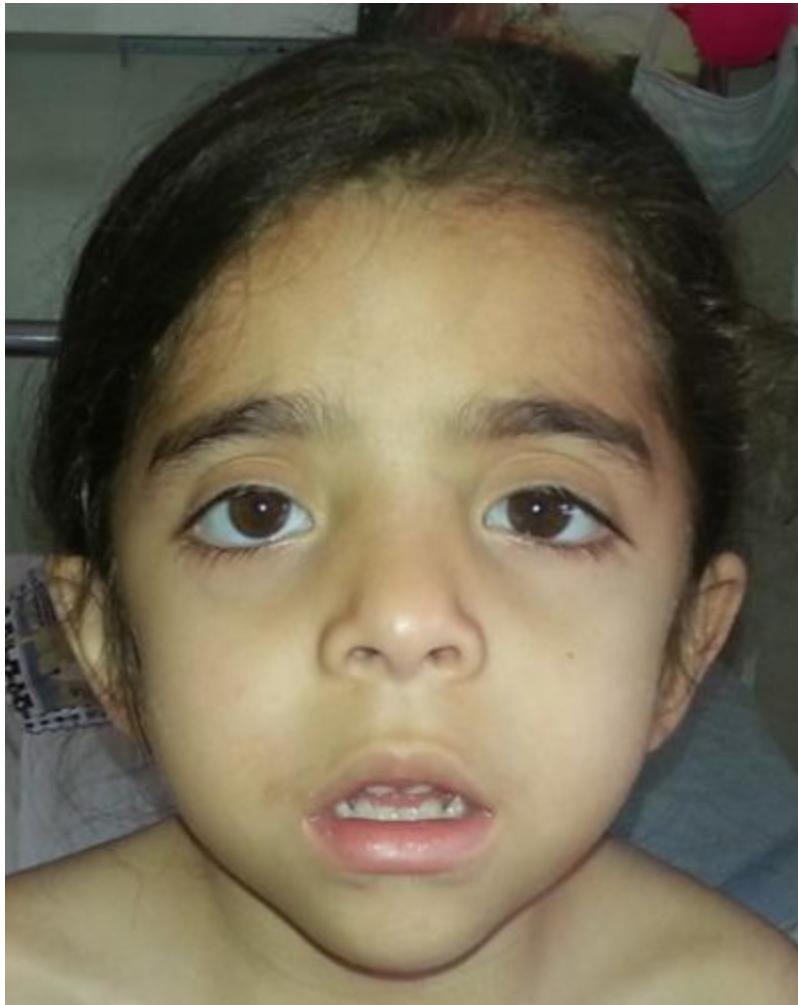

Facial characteristics of Angelman syndrome can include: deeply set eyes, pointed chin, wide mouth, as well as other findings.

Kabuki syndrome

Facial characteristics of Kabuki syndrome can include: arched and broad eyebrows, long

palpebral fissures with eversion of the lateral part of lower eyelids, prominent or cupped ears, and a depressed nasal tip and short columella, as well as other findings.

Noonan syndrome

Facial characteristics of Noonan syndrome can include: widely spaced eyes, low-set and posteriorly angulated ears, ptosis, downslanted palpebral fissures, and epicanthal folds, as well as other findings.

Williams syndrome

Facial characteristics of Williams syndrome can include: periorbital fullness, flat nasal bridge, small nose with upturned nasal tip, long philtrum, wide mouth, full lips, small chin, as well as other findings.

Faces and Phenotypic output Q1 to 3

You will now start viewing facial images. First, you will see the image without AI tool outputs. After making a decision for this image, you will be shown our AI tool outputs along with the image and you will be able to make a new prediction based on the additional information. Please note that not all images were correctly classified by the AI tool.

Block 14

Please give us some feedback on the saliency maps and the region relevance scores. For your feedback you might address the following questions, but please feel free to provide any comments that come to your mind: To what extent did you consider the AI prediction when deciding whether to stay or not with your original decision? To what extent did the saliency maps and the region relevance scores influence your decision? Do you have any suggestions to us on how to improve the visual explanations? Please enter your response in the text box below.

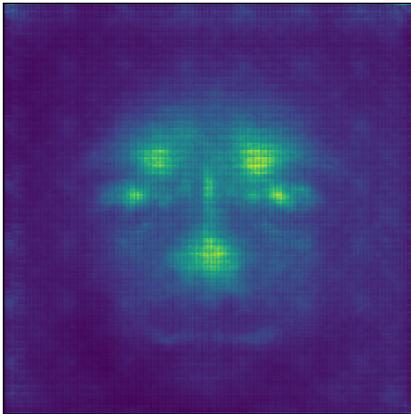

Optional

Do you have a few more minutes to look at average saliency maps to give us your thoughts?

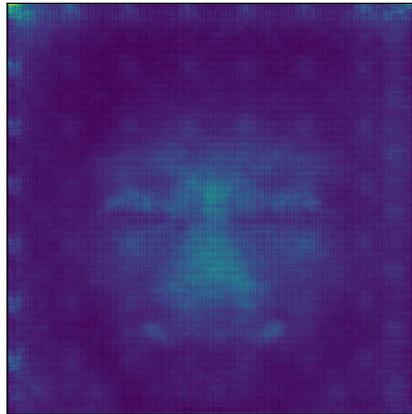

- Yes
- No

Average Saliency Maps per Syndrome (using DeepLIFT)

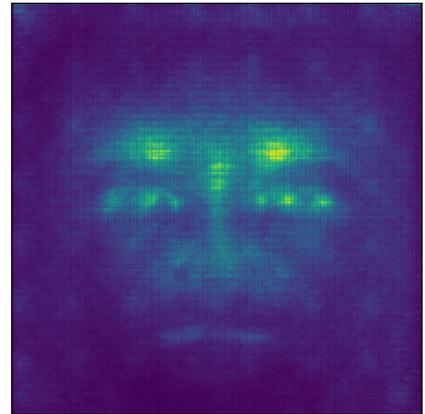

22q11DS

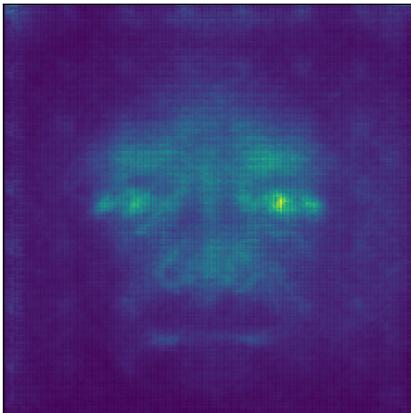

Angelman

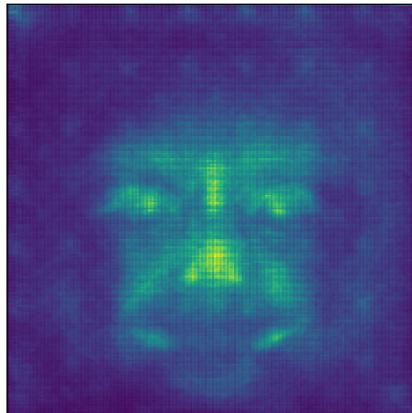

Kabuki

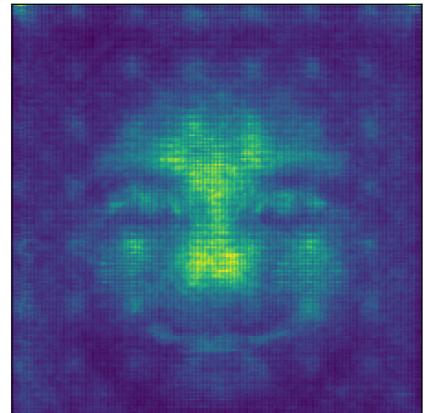

Noonan

Williams

Unaffected

Above are average saliency maps for each condition. A saliency map is another type of AI output that allows us to visualize which pixels the AI finds important in classifying or diagnosing an image. The average saliency map is an average of hundreds of images with the same condition. The pixels the AI tool finds to be most important in classifying a genetic condition are in yellow. The brighter the area on the face, the more important the pixel is in the AI tool classification. Please take a moment to look through the images.

Which, if any, of the above average saliency maps BEST highlight the important features for that condition? Select as many or few as you like.
